Week 4 Practice Activities

Let's put together what we learned last week (joining dataframes) and this week (visualizing data)!

We have two datasets:

(1) winter_fruit_vegetable_servings.csv
(2) summer_fruit_vegetable_servings.csv

Each dataset contains information about how many servings of fruits and vegetables a participant eats per meal. The "winter" survey data was collected in the winter, and the "summer" data was collected later that same year in the summer.

We want to see whether people eat more fruits and vegetables in one season than the other.

1. Load in both datasets. How many participants are in the "winter" dataset? How many are in the "summer" dataset? Did all participants complete both surveys?

2. Summarize the results from these participants to see differences between seasons. Is there a difference in the servings of fruits and vegetables eaten in the winter vs. summer? Is there a difference in the servings of fruits and vegetables eaten across the two seasons and the different meals? (Hint: you will need to join and reshape the data)

3. Create a plot of the data to demonstrate any differences between fruits and vegetables eaten during the two seasons.

4. Now, what about across the different meals? Create a plot to demonstrate any differences between seasons and meals. (Hint: a nice way of doing this is to use the facet_wrap() function on your ggplot object).
